What this report establishes

The signed receipt lets you detect changes to the bundled files. It does not establish an independently certified capture time or guarantee that a page was complete, accurate or legally admissible.

The capture.json file preserves response headers, available HTTP redirect metadata, browser usage and the capture settings. The page.html file contains the rendered DOM.

How to verify

1. Keep report.pdf, screenshot.png, page.html, capture.json and receipt.json together.
2. Obtain the service public key from a separately trusted source. A key provided only by an uploader cannot establish the service identity.
3. Verify receipt.json against that public key, then compare every listed file size and SHA-256 hash. The final receipt also includes the hash of this PDF.

Scope and limitations

- Rendered DOM, not original HTTP body or complete network archive.
- HTML and screenshot captured sequentially; dynamic content can change.
- Only configured hosts may load; third-party content can be omitted.
- Hostname guardrails do not themselves prove protection against DNS rebinding.
- No independent timestamp authority or legal admissibility guarantee.

Non-ASCII metadata is shown as Unicode escapes in this PDF. The original capture.json preserves the exact text.
